

TASK-6

- **Title:** Cross-Site Scripting (XSS) Vulnerability in Search Page
- **Risk Rating:** High
- **Vulnerability Description:** The search page does not properly check the data entered by users. Because of this, an attacker can insert a malicious script that runs in the user's browser.
- **Steps to Reproduce:**
 1. Open the search page.
 2. Type `<script>alert('XSS')</script>` in the search box.
 3. Click the search button.
 4. A pop-up message appears, showing that the website is vulnerable.
- **Impact:** This vulnerability can allow attackers to steal cookies, access user information, redirect users to fake websites, or perform actions using another user's account.
- **Remediation:** Validate all user input and convert special characters into safe text before displaying them on the webpage. Use secure coding methods such as input validation and output encoding to prevent malicious scripts from executing.
